Peripheral Connection Interfaces

Connection interface	advantage	disadvantage
USB	It gives a stable and fast connection and is easy to use.	A cable is required, so it can make the workspace messy.
Wi-fi	It allows wireless connection and multiple devices can use the printer.	It may be slower or unstable if the Wi-Fi signal is weak.
Bluetooth	It is wireless and easy to connect for short-distance use.	It has a shorter range and can be slower than a wired connection.

Conclusion:

Different connection interfaces are useful for different situations. USB is good for a stable connection, while Wi-Fi and Bluetooth are useful when we want to avoid cables.

Connecting a Printer to a Computer

Step-1 - check the printer

First, I place the printer near my computer and make sure the printer is switched off.

Step 2- connect the power

I connect the printer to my computer using a USB cable

Step 3- connect the power

I connect the printers power cable and switch it on

Step-4 – install the printer

I open the computer settings and add the printer. If required i install the printer driver

Step 5- check the connection

I check whether the computer detects the printer correctly.

Step 6- print a test page

Finally, i printed a test page to make sure the printer is connected and working properly.
