

Main Components Inside a Desktop PC

1. Motherboard

The motherboard is the main board of the computer. It connects the CPU, RAM, storage, and other components together.

2. CPU (Central Processing Unit)

The CPU is the main processor of the computer. It processes instructions and helps run different programs.

3. RAM (Random Access Memory)

RAM temporarily stores the data and programs that the computer is currently using. It helps the computer work smoothly.

4. CPU Cooler

The CPU cooler helps keep the processor cool. It usually has a heatsink and a fan.

5. GPU (Graphics Processing Unit)

The GPU handles graphics and images shown on the screen. It can be integrated into the processor or be a separate graphics card.

6. HDD (Hard Disk Drive)

An HDD is used to store files, programs, photos and videos. It uses moving parts to read and write data.

7. SSD (Solid State Drive)

An SSD is used for storing data and is faster than an HDD. It has no moving mechanical parts.

8. SMPS / PSU (Power Supply Unit)

The power supply provides power to all the components of the computer. It converts electricity into the type of power the PC needs.

9. Case Fans

Case fans move air inside the PC and help remove heat. They keep the components at a suitable temperature.

Desktop PC Disassembly Process

1

Step 1 – Unplug Power

2

Step 2 – Remove Side Panel

3

Step 3 – Disconnect Cables

4

Step 4 – Remove RAM

5

Step 5 – Remove Storage

6

Step 6 – Remove Motherboard

Disassembly Steps

Step 1 – Unplug Power

First, I switched off the PC and disconnected the power cable from the power supply.

Step 2 – Remove Side Panel

I removed the side panel of the gaming PC case to access the internal components.

Step 3 – Disconnect Cables

I carefully disconnected the power and data cables connected to the different components.

Step 4 – Remove RAM

I unlocked the RAM clips and carefully removed the RAM modules from the motherboard.

Step 5 – Remove Storage

I disconnected and removed the storage drive from the PC.

Step 6 – Remove Motherboard

After removing the connected components and cables, I carefully removed the motherboard from the PC case.

Reassembling the Desktop PC

1

Step 1 – Install Motherboard

2

Step 2 – Install Storage

3

Step 3 – Install RAM

4

Step 4 – Connect Cables

5

Step 5 – Connect Power Supply

6

Step 6 – Close Side Panel & Start PC

Reassembly Steps

Step 1 – Install Motherboard

I placed the motherboard inside the PC case and fixed it properly with screws.

Step 2 – Install Storage

I installed the SSD/HDD and connected the required storage cables.

Step 3 – Install RAM

I placed the RAM modules into the correct RAM slots and made sure they were properly locked.

Step 4 – Connect Cables

I connected to the required motherboard, storage and GPU cables correctly.

Step 5 – Connect Power Supply

I connected the power supply cables to the motherboard, CPU, GPU and storage devices.

Step 6 – Close Side Panel & Start PC

After checking all the connections, I closed the side panel and started the PC to check that everything was working properly.

Safety Precautions and Tools

- **Switch off the PC** — Always shut down the PC before opening the cabinet.
- **Unplug the power cable** — Disconnect the power cable to avoid electrical risk.
- **Handle components carefully** — Hold RAM, motherboard and other parts carefully and avoid touching sensitive contacts.
- **Keep screws safely** — Keep all screws in one place so they are not lost.
- **Do not force connectors** — Disconnect and connect cables gently to avoid damaging them.
- **Prevent static electricity** — Discharge static electricity before touching internal components.

Tool	Why it is needed
screwdriver	Used to remove and tighten PC screws.
Small container	Used to keep screws safely.
Anti-static wrist strap	Helps reduce the risk of static electricity damaging components
Clean workspace	Gives enough space to safely work with PC components.
