

RAM and Storage

RAM Type	SPEED	voltage	Typical use case
DDR 3	800-2133 MT/s	1.5 V	Older computer and laptops
DDR 4	1600-3200 MT/s	1.2 V	Modern computers and laptops
DDR 5	4800 MT/s and above	1.1 V	New generation and high-performance computer

Short explanation

DDR 3 is an older type of RAM and is mainly found in old computers. DDR 4 is faster and uses less voltage than DDR 3. DDR 5 is the newest of these three and provides higher speed and better performance for new computers.

HDD vs SSD vs NVME

Storage type	Difference	Daily Use / App
HDD	It is slower and has moving mechanical parts.	Good for storing movies, photos, and large files.
SSD	It is faster than HDD and has no moving parts.	Useful for Windows, Chrome and daily applications.
NVMe	It is faster than normal SATA SSD because it uses the PCIe interface.	Useful for gaming, video editing, and other heavy applications.

1. Speed:

HDD is the slowest; SSD is faster, and NVMe is generally the fastest.

2. Connection:

HDD and normal SSD usually use SATA connections, while NVMe drives use the PCIe interface through an M.2 slot.

3. Performance and Use:

HDD is good for large and less frequently used files. SSD is good for normal daily use, while NVMe is better for gaming and heavy applications where fast loading is useful.
